

## README

**Name of Game:** “Goblins’ Keep”

**Group Members:** Jonah Uhrich, Kane Cruz-Walker, Hung Quach

### **Current Target:**

Our game is a first-person dungeon crawler. We originally planned to have different types of enemies, however, currently we only have goblins. The enemies can patrol around until they detect a player. Once the player is detected, enemies will chase the player and try to attack them (melee attacks). The player will attack with a sword. Once enemies are defeated, we planned for them to give the player XP, giving the player the ability to level up and increase their attack, stamina, and health status by a set amount. However, we have yet to implement this mechanic. Goblins may also drop health potions upon death (RNG dependent), which we also plan to implement later. After all enemies are defeated, the player can then interact with a bonfire, which gives the player the option to heal and advance to the next level.

We plan to have at least three stages: a tutorial level, a regular/main level, and then a boss fight level. If the boss fight proves hard to implement or unachievable due to time, we plan to create another, more difficult regular level instead. The boss fight will take place in a dedicated arena section of the dungeon. The boss itself will still have only melee attacks, however with more health and damage to increase the difficulty.

### General Goals for Each Person

Jonah: Finding/creating art, animations, and sound effects. Implemented the lighting for the environment, as well as point lights for the player, torches, and bonfires. Level Design. Also helped with creating a basic chase script for the goblins.

Kane: Implementing inventory system. Will implement stat functionality and XP functionality from goblin deaths. Will implement UI prompt for when user gains XP and updates their level. Designing the dungeon that goes after the tutorial dungeon. Will incorporate puzzle functionality / easter eggs to make it more than just a combat dungeon crawler.

Hung: Implemented the animations and sound effects that Jonah found for the player and enemies. Created the first-person camera system. Implemented the movement, health, and attack system for both the player and the enemies. Created instruction UI used in the tutorial level, player UI, and other UI related features. Started on the implementation of the bonfire interface. Plans to polish the start screen and bonfire interface as well as implement sound for the torches and bonfire. Deciding with Jonah on the background music (ambience).
